Ambient assisted living (AAL)

We will focus on a robot that assists elderly people in their everyday life. There are several issues that need to be solved to assure usable robot.

- The robot should be able to localize itself in the building (GPS does not work inside buildings)
- The robot has to understand human commands and it should be possible to call robot from any place in the building if help or assistance is needed (the robot should know where we are)
- The robot should be able to understand sentiments of the human commands (*Help me you stupid robot!*)
- The robot should be able to move freely in the building and identify threats (obstacles, laying person, fire, smoke)

Subtasks

- We need a robot (Lego Mindstorm robot somehow connected with Android mobile phone)
- Localization via trilateration, BLE beacons (and possibly the particle filtering)
- Following human wearing BLE necklace
- Speech recognition based on grammar/language model
- Full navigation and object detection in building
